

RAVEN

Product Build Brief

A booking-generation platform and multi-tenant website system for Ten Fifty Bakers, The Prescription Pad and Annie May.

BUILD DIRECTION

Find demand. Fill empty nights. Convert more direct bookings.

Prepared for implementation in Fable • July 2026

What Raven is being built to do

Raven finds accommodation demand, identifies empty dates and turns those opportunities into direct bookings.

Raven should not become another property-management system.

Lodgify already handles bookings, calendars, availability, channel management and guest communication. Raven sits alongside it and concentrates on demand generation, website conversion and filling vacant nights.

RAVEN OWNS	LODGIFY CONTINUES TO OWN
Event intelligence Opportunity recommendations Property websites and SEO pages Marketing campaigns Occupancy-gap activation	Booking records Calendars and availability Channel management Guest messaging Core property operations

The five core modules

01	Event Monitor - Discovers and scores dates likely to generate accommodation demand.
02	Opportunity Feed - Turns signals into clear, prioritised actions for the owner.
03	Website Builder - Runs all property websites and generates targeted event pages.
04	Campaign Generator - Creates coordinated content around each booking opportunity.
05	Occupancy Gap Finder - Finds vacant nights and triggers the best response.

02 / PROPERTY PORTFOLIO

Raven is marketing three different products

Opportunity recommendations, website structures and campaign creative must reflect each property's location, inventory model and ideal guest. A high-demand event is only useful when it matches the property.

Ten Fifty Bakers

BAKERS BEACH - 30 MINUTES FROM DEVONPORT

A premium off-grid wilderness destination: the stay itself is the reason to travel.

Inventory and strengths

Whole-property stay for up to 10 guests; five bedrooms; 1,137 acres; private trails; Narawntapu access; wood-fired sauna; outdoor baths; wildlife, dark skies and Starlink.

Strongest opportunities

Nature and walking escapes, wellness retreats, romantic or luxury weekends, photography, wildlife, horse-riding groups, multi-night family and friendship stays.

Use caution

Do not automatically target short city events, late-night events or one-night overflow demand. Distance and the remote experience can outweigh raw attendance.

The Prescription Pad

SHEARWATER - AROUND 20 MINUTES FROM DEVONPORT

A social, coastal group house designed for families and friends to spend time together.

Inventory and strengths

Whole-property stay for up to 10; flexible king or single beds; two lounges; hot tub; pool table; 98-inch TV; group kitchen; gym access; walk to beach, pub and shops.

Strongest opportunities

Family holidays, milestone weekends, friendship groups, school holidays, coastal events, sporting groups, wedding parties and Port Sorell or Shearwater demand.

Use caution

Weak fit for solo travellers and most couples. Campaigns must justify booking an entire large house and respect seasonal minimum stays.

Annie May

CENTRAL DEVONPORT

An elegant adults-only heritage guesthouse for short, refined stays close to the city and transport.

Inventory and strengths

Seven separately bookable ensuite rooms for two adults; breakfast included; king rooms; two rooms with baths; central location; minutes from the Spirit of Tasmania and Devonport Airport.

Strongest opportunities

Devonport events, conferences, business travel, couples, wedding guests, pre/post-Spirit stays, short breaks, dining weekends and room-level last-minute demand.

Use caution

Do not send family-with-children campaigns. Raven must score and market room inventory, not assume the entire building is one bookable unit.

03 / WEBSITE REBUILD STRATEGY

Three websites, three conversion strategies

The builder should share components and publishing infrastructure, but it must not force the properties into one generic accommodation template.

TEN FIFTY BAKERS	THE PRESCRIPTION PAD	ANNIE MAY
Lead with the destination. Cinematic landscape imagery, private wilderness, views, wildlife, sauna and outdoor baths. The website should create desire before presenting logistics.	Lead with the group. Show capacity, bed arrangements, shared spaces, group pricing and what ten people can do together. Make planning and decision-sharing easy.	Lead with rooms and location. Show room-level availability, ensuite differences, breakfast, adults-only calm and proximity to Devonport, the Spirit terminal and airport.
Core pages The retreat; stay; wilderness and wildlife; sauna and baths; walks; groups and retreats; Bakers Walking Co; local area; availability.	Core pages Group stay; bedrooms and layout; families; friends and celebrations; beach and local area; facilities; seasonal pricing; availability.	Core pages Rooms; room detail pages; story and heritage; breakfast; adults-only stays; Devonport guide; Spirit stopovers; business stays; availability.
Primary conversion Sell a two-to-four-night escape or package, then pass verified dates and guests into Lodgify's booking flow.	Primary conversion Help one organiser confidently book for six to ten people, including transparent total pricing and minimum stays.	Primary conversion Let guests compare individual rooms, check exact room availability and book a short stay with minimal friction.

CURRENT-SITE MIGRATION CHECKPOINT

Ten Fifty Bakers currently sends bookings to Airbnb; Annie May's room links currently point to Preno; and The Prescription Pad uses its own booking route. Before Raven becomes the public booking layer, confirm that all three inventories are correctly mapped in Lodgify and decide when Lodgify becomes the authoritative source of truth.

Sources reviewed 17 July 2026: <https://www.tenfiftybakers.com.au/> • <https://theprescriptionpad.com.au/> • <https://anniemay.com.au/> Property rules, inventory and booking mappings must be confirmed during onboarding.

04 / PROPERTY-OPPORTUNITY MATCHING

Do not recommend every event to every property

Raven should first detect demand, then score the opportunity separately for each property. A large event can still be a poor match because of travel distance, guest type, inventory shape or minimum-stay requirements.

Illustrative suitability matrix

Devonport conferences and city events	LOW	MEDIUM	HIGH
Spirit of Tasmania stopovers	LOW	MEDIUM	HIGH
Family school-holiday demand	HIGH	HIGH	LOW
Sporting teams and tournaments	MEDIUM	HIGH	MEDIUM
Weddings and milestone groups	HIGH	HIGH	HIGH
Walking, wildlife and wellness	HIGH	MEDIUM	MEDIUM
Business and short corporate stays	LOW	MEDIUM	HIGH
Romantic and premium escapes	HIGH	LOW	HIGH
Shearwater and Port Sorell events	MEDIUM	HIGH	MEDIUM

Suggested scoring model

DEMAND	LOCATION	GUEST FIT	INVENTORY	STAY FIT
25% Attendance and accommodation pressure	20% Travel time and event geography	25% Audience, age and trip purpose	20% Rooms, whole-home capacity and availability	10% Length, minimum stay and achievable value

Feed rule: name the recommended property, show its score and explain why the others ranked lower.

05 / MODULES 1-2

Modules 1 and 2: discover demand, then make it actionable

1. Event Monitor

Raven continuously discovers events and dates likely to increase accommodation demand. It connects external demand signals with the live availability of each property.

- Festivals and concerts
- Sporting events
- Conferences
- Council and community events
- Cruise ship arrivals
- School and public holidays
- Long weekends
- Seasonal tourism patterns

Every opportunity should be scored against:

- Distance from each property
- Expected attendance
- Likely accommodation demand
- Relevant arrival and departure dates
- Current availability
- Booking urgency
- Recommended minimum stay
- Suggested price adjustment
- Marketing potential

2. Raven Opportunity Feed

The main dashboard is an actionable feed, not a conventional analytics screen. It should answer one question: where is the next booking likely to come from?

HIGH-PRIORITY OPPORTUNITY

Agfest is 47 days away

Two properties still have availability. Estimated accommodation demand is high.

Recommended actions

- Create and publish an Agfest accommodation page
- Increase prices by 12% and consider a two-night minimum stay
- Generate Facebook, Instagram and email campaigns
- Send traffic directly to the new Agfest page

Actions: APPROVE • MODIFY • DISMISS

The feed should also surface unfilled date ranges, last-minute vacancies, seasonal opportunities, suggested campaigns, pricing changes and pages that should be created.

Module 3: the full multi-tenant website builder

This module is broader than an event-page generator. All three public property websites will be created, edited, controlled and published from inside Raven.

Each property has its own genuine custom domain, branding and content - while all three run from one shared website system hosted on Vercel.

Recommended architecture

LAYER	RESPONSIBILITY
Raven	Central management platform, website editor, recommendations and publishing controls.
Vercel	One multi-tenant deployment that serves every public property domain.
Supabase	Stores properties, users, branding, page content, settings and media references.
Lodgify	Provides availability, pricing information and the booking flow.
Custom domains	Each property retains an independent public identity and can be indexed separately.

One platform, three distinctive websites

Every website must remain flexible enough to feel genuinely individual, while sharing a dependable set of booking and SEO capabilities.

Identity Custom domain; logo; colours; typography; favicon; distinct visual system.	Structure Editable navigation; homepage; accommodation pages; standard content pages; experiences and packages.	Media Image and video galleries with reusable property media libraries.
Conversion Live availability; prominent booking actions; Lodgify booking integration; enquiry options.	Trust Testimonials; FAQs; location information; policies; property highlights.	Responsive design Fully usable and visually polished across mobile, tablet and desktop.
SEO Editable metadata; structured accommodation data; canonical URLs; internal linking; individual sitemaps.	Measurement Property-specific analytics, conversion events and advertising pixels.	Publishing Draft, preview and published states; version-aware publishing; immediate cache refresh.

Critical implementation rule

Generated output is always a starting point. Every piece of text, image, offer, button, layout choice and SEO setting must remain editable before publication.

Turn demand signals into search-ready landing pages

The website builder must generate additional pages around events, seasonal demand, packages and specific booking opportunities. These pages capture targeted organic and paid traffic rather than sending everyone to a generic homepage.

Example pages

Accommodation near Agfest Targeted page for the strongest property and audience.	Where to stay for the Devonport Marathon Targeted page for the strongest property and audience.	Spirit of Tasmania accommodation Targeted page for the strongest property and audience.
Winter accommodation packages Targeted page for the strongest property and audience.	Romantic weekend escapes Targeted page for the strongest property and audience.	Wildlife and walking experiences Targeted page for the strongest property and audience.

Each generated page should contain

- Event or offer information
- Distance and travel details
- Relevant accommodation options
- Live availability
- Direct booking buttons
- Maps
- Packages or special offers
- Frequently asked questions
- SEO metadata
- Internal links to property pages

Generation and publishing sequence

1	Raven detects an opportunity and selects the most relevant property.
2	It generates the initial page using verified event and property information.
3	The user reviews and edits content, imagery, offer, URL and SEO settings.
4	The page is previewed, published and added to the correct sitemap.
5	Campaign traffic is directed to this specific page and availability is monitored.

Create the campaign, then target the occupancy gap

4. Campaign Generator

Raven turns an event, offer or vacancy into a coordinated marketing campaign. Early versions should generate content for review and approval rather than publish autonomously.

Social
Facebook posts, Instagram posts and carousels, reel concepts and captions.

Direct
Email campaigns and reusable messages for previous guests.

Paid
Google and social advertisement copy, suggested audience, dates and budget.

On-site
Website banners, supporting articles and direct links to relevant landing pages.

5. Occupancy Gap Finder

Raven uses Lodgify availability to detect nights that require marketing intervention, including isolated nights, two-to-four-night gaps, empty weekends, approaching vacancies, cancellations and lower-than-expected future occupancy.

DETECT	MATCH	ACTIVATE	MONITOR
Find a valuable vacancy or newly opened cancellation.	Check events, seasons, audience and the strongest property offer.	Recommend price, page, package and coordinated campaign.	Watch availability; stop or revise once dates are booked.

Campaigns should link directly to the relevant property, event or offer page - never merely to a generic homepage.

10 / LODGIFY INTEGRATION

Use Lodgify as the booking source of truth

Raven should use Lodgify data to understand what can still be sold, while leaving channel management and the authoritative booking transaction inside Lodgify. Public websites remain on Vercel, and all Lodgify API calls are made server-side through Raven's backend.

Property and inventory mapping

PUBLIC WEBSITE	INVENTORY MODEL	REQUIRED LODGIFY MAPPING
Ten Fifty Bakers	One whole-property rental	Website tenant -> Lodgify property ID -> house/rental ID -> availability, stay rules and booking flow.
The Prescription Pad	One whole-property group rental	Website tenant -> Lodgify property ID -> house/rental ID -> guest-based pricing, minimum stays and booking flow.
Annie May	Seven separately bookable rooms	Website tenant -> Lodgify property ID -> each room/unit ID. Raven must preserve room-level availability and never collapse the guesthouse into one unit.

Raven's initial integration responsibilities

READ	CACHE AND CALCULATE	DISPLAY OR HAND OFF
Property and unit identifiers; bookings and reservation status; occupied dates; available inventory; stay rules and rate data exposed by the account.	Normalise dates and time zones; build occupancy gaps; match rooms or whole homes; cache safe snapshots; calculate opportunity scores.	Show current availability indicators; generate targeted pages; then send the guest into the authoritative Lodgify booking flow to confirm price and complete payment.

PHASE 1 - READ-FIRST	PHASE 2 - CONTROLLED WRITES
Raven recommends prices, minimum stays, campaigns and pages. The owner approves changes and Lodgify remains authoritative.	Only add write actions supported by the verified Lodgify endpoint and account permissions. Require explicit approval, validation, an audit record and a reversible previous value.

11 / API RELIABILITY

Design well below Lodgify's rate limits

Lodgify documents both technical and partner-usage controls. Requests that exceed a limit receive HTTP 429, and abusive integrations can be blocked automatically.

ENDPOINT	VERSION	PUBLISHED ABSOLUTE LIMIT
api.lodgify.com	v1	600 requests per minute
api.lodgify.com	v2	750 requests per minute
lodgify.com/*.ics	ICS	10 requests per minute

Recommended starting sync pattern

DATA	STARTING CADENCE	WHY
Property and unit configuration	Daily and after an admin change	Changes infrequently; cache aggressively.
Bookings and availability	Every 5-15 minutes, plus manual refresh	Fresh enough for opportunity detection without polling per page view.
Public website requests	Serve Raven's cache	Traffic spikes must not create matching Lodgify spikes.
Final booking	Real-time in Lodgify	Lodgify confirms the final price and sellable inventory.

SAFE-SCALE EXAMPLE

Even five API calls per property every five minutes across three properties equals about 180 calls per hour, or 3 calls per minute on average. This is far below the published v1 and v2 absolute limits, but Raven should still control bursts and partner-usage requirements.

Official rate-limit reference: <https://docs.lodgify.com/docs/rate-limits>

12 / API SAFEGUARDS

Keep Raven useful when Lodgify is slow or unavailable

Rate limiting is not only about staying below a numeric ceiling. Raven needs predictable behaviour during traffic bursts, expired credentials, transient errors and Lodgify downtime.

Required controls

Queue Route all Lodgify work through a central server-side queue with per-account throttling.	Deduplicate Collapse identical refresh jobs so one trigger produces one API request sequence.
Cache Store normalised booking and availability snapshots with a visible fetched-at time.	Back off After HTTP 429, pause retries exponentially and honour Retry-After when supplied.
Protect Open a circuit breaker during sustained failure instead of repeatedly hitting the API.	Observe Log request counts, response codes, latency, sync age, manual refreshes and failures.
Avoid ICS abuse Do not use frequent calendar polling; Lodgify publishes a 10-per-minute ICS ceiling.	Register Before offering Raven to unrelated operators, contact Lodgify about third-party partner registration.

Freshness states shown inside Raven

STATE	USER-FACING BEHAVIOUR	SYSTEM ACTION
Fresh	Normal opportunity recommendations and availability indicators.	Continue scheduled sync.
Stale	Show last-known data and the time it was retrieved; avoid claiming live availability.	Retry in the background with backoff.
Unavailable	Suppress automatic price or stay-rule actions; keep website content online.	Open circuit, alert admin and send bookings to Lodgify for final verification.
Recovered	Resume recommendations only after a successful reconciliation sync.	Compare changed bookings and rebuild gaps before continuing.

Final rule: stale data may be shown only when labelled; Lodgify must verify final sellable dates and price before payment.

13 / END-TO-END SYSTEM

The booking-generation workflow

The system closes the loop

Raven does not stop after producing content. It checks Lodgify for the resulting booking, detects when the targeted dates are filled, and then stops or updates the campaign so effort is redirected to the next opportunity.

MVP priorities

01 Generate more bookings for the initial three properties.	02 Produce fast, SEO-indexable property and event pages.
03 Find and actively market vacant dates.	04 Make every recommendation clear, prioritised and actionable.
05 Keep every generated output editable and approval-led.	06 Integrate with Lodgify instead of rebuilding property management.
07 Support both whole-property and room-level inventory correctly.	08 Score opportunities separately for each property and explain the match.

Raven is not another property-management system. It is a booking-generation engine that discovers demand, builds the websites and campaigns needed to capture it, and helps fill vacant nights.
